## Butabarbital Sodium Oral Solution

### DEFINITION

Butabarbital Sodium Oral Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of butabarbital sodium ( $C_{10}H_{15}N_2NaO_3$ ).

### IDENTIFICATION

**Change to read:**

- **A.** ▲ [SPECTROSCOPIC IDENTIFICATION TESTS \(197\)](#), [Infrared Spectroscopy: 197K](#)▲ (CN 1-MAY-2020)

**Sample:** Transfer an equivalent to 150 mg of butabarbital sodium from a volume of Oral Solution, to a separator. Render it distinctly alkaline by the addition of 1 N sodium hydroxide, and saturate it with sodium chloride. Extract the mixture with two 15-mL portions of ether, and discard the ether. Acidify the solution with hydrochloric acid, and render it just alkaline to litmus by adding small portions of sodium bicarbonate (carbonate-free). Extract the liberated acid barbiturate using five 20-mL portions of chloroform. Wash the combined chloroform extracts with 10 mL of water acidified with 1 drop of hydrochloric acid, then extract the water with 10 mL of chloroform, adding the latter to the main chloroform solution. Pass the chloroform solution through a pledget of cotton or other suitable filter, previously washed with chloroform, into a tared beaker, and finally wash the separator and the filter with three 5-mL portions of chloroform. Evaporate the combined chloroform solution and washings on a steam bath with the aid of a current of air to dryness, and dry the residue at 105° for 2 h.

**Acceptance criteria:** Meets the requirements

- **B.** The retention time of the butabarbital peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### • PROCEDURE

**Solution A:** Dissolve 2.0 mL of bromine and 10 g of potassium bromide in 60 mL of water.

**Solution B:** Sodium metabisulfite in water (1 in 10)

**Internal standard solution:** 0.7 mg/mL of secobarbital in chloroform

**Standard solution:** 1 mg/mL of [USP Butabarbital RS](#) and 1.4 mg/mL of secobarbital in chloroform

**Sample stock solution:** Nominally 0.3 mg/mL of butabarbital sodium from Oral Solution prepared as follows. Transfer a volume of Oral Solution, equivalent to 30 mg of butabarbital sodium, to a separator. Add 1 mL of *Solution A*, and swirl. Allow to stand for 5 min, add 1 mL of *Solution B*, and swirl. Add 300 mg of sodium bicarbonate in small portions, with mixing, and extract with four 10-mL portions of chloroform. Pass the extracts through about 15 g of anhydrous sodium sulfate that is supported on a funnel by a small pledget of glass wool. Collect the combined filtrates in a 50-mL volumetric flask, wash the sodium sulfate with 5 mL of chloroform, collecting the washing with the filtrate, dilute with chloroform to volume, and mix.

[NOTE—This solution includes a bromination step for elimination of parabens and a carbonate–chloroform extraction for elimination of benzoic acid.]

**Sample solution:** Combine 2.0 mL of *Sample stock solution* with 2.0 mL of *Internal standard solution* in a suitable container, and reduce the volume to about 1 mL by evaporation, with the aid of a stream of dry nitrogen, at room temperature.

#### Chromatographic system

(See [Chromatography \(621\)](#), [System Suitability](#).)

**Mode:** GC

**Detector:** Flame ionization

**Column:** 4-mm × 0.9-m glass; packed with 3% liquid phase G10 support on 80- to 10-mesh S1A

#### Temperatures

**Injection port:** 225°

**Detector:** 225°

**Column:** 200 ± 10°

**Carrier gas:** A suitable gas such as dry nitrogen

**Flow rate:** 60–80 mL/min

**Injection volume:** 5 µL

#### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention times for butabarbital and secobarbital are 0.6 and 1.0, respectively.]

**Resolution:** NLT 2.4 between butabarbital and secobarbital

**Tailing factor:** NMT 2.0 each for butabarbital and secobarbital

**Relative standard deviation:** NMT 1.5% for the peak response ratio of butabarbital to the internal standard

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of butabarbital sodium ( $C_{10}H_{15}N_2NaO_3$ ) in the portion of Oral Solution taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$R_U$  = peak response ratio of butabarbital to the internal standard from the *Sample solution*

$R_S$  = peak response ratio of butabarbital to the internal standard from the *Standard solution*

$C_S$  = concentration of [USP Butabarbital RS](#) in the *Standard solution* (µg/mL)

$C_U$  = nominal concentration of butabarbital sodium in the *Sample solution* (µg/mL)

$M_{r1}$  = molecular weight of butabarbital sodium, 234.23

$M_{r2}$  = molecular weight of butabarbital, 212.25

**Acceptance criteria:** 90.0%–110.0%

#### OTHER COMPONENTS

- [ALCOHOL DETERMINATION, Method II\(611\)](#): Between 95.0% and 115.0% of the labeled amount of alcohol ( $C_2H_5OH$ )

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers. Store at controlled room temperature.
- [USP REFERENCE STANDARDS \(11\)](#),  
[USP Butabarbital RS](#)

**Auxiliary Information** - Please [check for your question in the FAQs](#) before contacting USP.
